

ABSTRACT

The present invention relates to an illustrative drug card to help patients understand when and how to administer medications. The illustrative drug card uses illustrations and symbols allowing patients to easily differentiate between medications, recognize which pills to administer at different times of a day, and recognize which medications to administer with food. Additionally, the illustrative drug card may take the form of a refrigerator magnet, or a foldable, wallet-sized booklet. Furthermore, the illustrative drug card may be printed in several languages, including brail, allowing blind patients to read the brail.
